

## ANNEX 5: ANALYSIS OF DATA MATURITY BY INCOME LEVEL

For the 59 organisations where we have validated income data we have plotted the income against data maturity score for the whole organisation. Note we used the log scale due to the wide range of income levels. (Plotting actual income would have bunched-up most of high income results into a corner to allow for the extreme low values to be plotted at the other end of the scale.) The analysis shows there's no significant correlation between the income and data maturity score.

Number of organisations: 59
